

**REMARKS**

This letter is responsive to the office action mailed January 22, 2010.

Claims 1, 7-14, 23, 29-36, and 45-46 are cancelled, without prejudice. Applicants reserve the right to address the Examiner's arguments in respect of the cancelled claims in a continuation or divisional application.

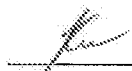

In order to expedite prosecution of the application and without prejudice, new claims 47 to 55 are presented, directed to a particular embodiment described primarily at, for example, paragraphs [0009] and [0025], and Figure 2.

Accordingly, **claims 47 to 55** are pending in the application. Claims 47, 50 and 53 are independent.

The claimed embodiment relates specifically to the encryption of text that is being viewed on a mobile device. This embodiment allows for the encryption of the text to be performed by a processing server remote from the mobile device. This may conserve processing resources, which are typically limited on mobile devices. Furthermore, the use of a proprietary processing server would not be required. Third party encryption servers may be used, for example, even if such servers only accept text in the hypertext markup language (HTML) as input. Moreover, such encryption servers may be used regardless of the format in which the text resides on the mobile device as the proxy server can format the text as necessary.

Further consideration of the application is respectfully requested.
